point

1.

Which of the following results in a syntax error?

☐

```
1  '''yesno'''|
```

☐

```
1  'yes\nno'|
```

☐

```
1  'yes
2  no'|
```

☐

```
1  "yes
2  no"|
```

1
point

2.

Which of the following results in a syntax error?

☐

```
1  '3\'|
```

☐

```
1  '"Once upon a time...", she said.'|
```

☐

```
1  "He said, "Yes!"|
```

☐

```
1  ''That's okay''|
```

Strings and Designing Functions

Quiz, 18 questions

3.

The following is printed by a **print** function call:

```
1 yesterday
2 today
3 tomorrow
```

Select the function call(s) that prints what is shown above.

- ☐

```
1 print('yesterday
2 \ntoday
3 \ntomorrow')
```
- ☐

```
1 print('yesterday
2 today
3 tomorrow')
```
- ☐

```
1 print('yesterday\ntoday\ntomorrow')
```
- ☐

```
1 print('yesterday
2 today
3 tomorrow')
```
-

4.

The following is printed by a **print** function call:

```
1 hello-how-are-you
```

Select the function call(s) that prints what is shown above.

- ☐

```
print('hello', 'how', 'are', 'you')
```
- ☐

```
print('hello', '-', 'how', '-', 'are', '-', 'you')
```
- ☐

```
print('hello' + '-' + 'how' + '-' + 'are' + '-' + 'you')
```
- ☐

```
print('hello-' + 'how-are-you')
```
- ☐

```
print('hello', 'how', 'are', 'you' + '-' * 4)
```
-

5.

Consider this code fragment:

Strings and Designing Functions

```
1  >>> def announce_location(country):
2      # Missing function body
3  >>> instructor_location = announce_location('Canada')
4  >>> print(instructor_location)
5  Canada
6
```

Select the missing function body from the options below.

- ☐ `return country`
- ☐ `print(country)`
- ☐ `return instructor_location`
- ☐ `print('Canada')`

1
point

6.

Consider this code fragment:

```
1  >>> def announce_location(country):
2      # Missing function body
3
4  >>> instructor_location = announce_location('Canada')
5  Canada
6  >>> print(instructor_location)
7  Canada
```

Select the missing function body from the options below.

- ☐ `print(country)`
- ☐ `return country`
- ☐ `print(country)`
- ☐ `print(country)`
- ☐ `return country`
- ☐ `return country`

1
point

7.

Consider the following statements:

```
1  x = None
2  print(x)
```

What is printed when the code above executes?

None

Strings and Designing Functions

Quiz, 18 questions

8.

What is the first step of the *Design Recipe*?

- ☐ Examples
 - ☐ Type Contract
 - ☐ Test
 - ☐ Code
-

9.

What is the last step of the *Design Recipe*?

- ☐ Type Contract
 - ☐ Test
 - ☐ Examples
 - ☐ Code
-

10.

What is the **Type Contract** for the following function definition?

```
1 def is_passing_grade(grade):  
2     """Return 'pass' if grade is at least 50 and return 'fail' otherwise.  
3     >>> is_passing_grade(45)  
4         'fail'  
5     >>> is_passing_grade(80.5)  
6         'pass'  
7     """
```

- ☐ (int, float) -> str
 - ☐ (float) -> str
 - ☐ (int) -> str
 - ☐ (number) -> str
-

11.

What is the **Type Contract** for the following function definition?

Strings and Designing Functions

←
 1 def total_vowels(word1, word2):
 2 """Return the number of vowels in words word1 and word2.
 3 """
 4 >>> total_vowels('hello', 'hi')
 5 3
 6 """

- ☐ (str, str) -> float
- ☐ (int) -> str, str
- ☐ (str, str) -> int
- ☐ str == int

1
point

12.

According to the **Description** of function `get_oldest`, what value should be returned by the **Example** function call?

```
1 def get_oldest(age1, age2):
2     """(int, int) -> int
3
4     Return the oldest of the two ages, age1 and age2.
5
6     >>> get_oldest(27, 22)
7     ???
8     """
```

27

1
point

13.

Here is an insufficient docstring for function `euro_to_dollars`:

```
1 def euro_to_dollars(amount):
2     """(number) -> number
3
4     Calculate the value in Canadian dollars of the given quantity of Euros.
5     """
```

Identify the problem(s) with the **Description** in the docstring above.

- ☐ It doesn't explain which Python operators are used to perform the calculation.
- ☐ It doesn't mention the parameters by name.
- ☐ It doesn't say what the function returns.
- ☐ It doesn't mention the parameter types.

Strings and Designing Functions

Quiz, 18 questions

14.

Two function definitions are saved in the same file:

- A function `count_vowels` has one parameter, a word, and returns the number of vowels in that word.
- A function `count_consonants` has one parameter, a word, and returns the number of consonants in that word.

To determine the number of letters in a word, write a one-line body for the following function that calls both `count_vowels` and `count_consonants`:

```
1 def count_letters(word):
2     """ (str) -> int
3
4     Return the number of letters in word.
5     >>> count_letters('hello')
6         5
7     >>> count_letters('bonjour')
8         7
9     """
10    # Write the one-line function body that belongs here.
```

Note:

- do not call any functions other than those listed above
- do not use any unnecessary parentheses

```
return count_letters(word) + count_consona
```

15.

Two function definitions are saved in the same file:

- A function `get_capital` has one string parameter that represents a country and returns its capital.
- A function `longer` has two string parameters and returns the longer of the two strings.

Variables `country1` and `country2` refer to `str` values. Write a one-line expression that produces the longer of the capitals of `country1` and `country2`. Your expression should involve calls on both `get_capital` and `longer`.

Note:

- do not call any functions other than those listed above
- do not use any unnecessary parentheses

```
return longer(get_capital(country1), get_capi
```

16.

What is the value of **average** after the following code is executed?

Strings and Designing Functions

← Quiz, 18 Questions

```

1 grade1 = 80
2 grade2 = 90
3 average = (grade1 + grade2) / 2
4 grade1 = 100

```

☐ 95.0

☐ 95

☐ 85.0

☐ 85

point

17.

Below is an image of the Python Visualizer in action. The line with the red arrow (line 15) is about to be executed. When we press **Forward**, function **convert_to_minutes** will be called, control will move to line 11 of the code (the first line of that function), and a new stack frame will be created containing variable **num_hours**. What value will **num_hours** refer to then? (We are looking for a value, not a memory address.)

(If the image is too small, right-click on it and open it in a new browser tab. Then you can zoom in.)

```

1 def convert_to_minutes(num_hours):
2     """ (int) -> int
3
4     Return the number of minutes there are in num
5     hours.
6
7     >>> convert_to_minutes(2)
8     120
9     """
10
11     result = num_hours * 60
12     return result
13
14 hours_asleep = 5
15 minutes_asleep = convert_to_minutes(hours_asleep)

```

Strings and Designing Functions

The line with the red arrow (line 15) is about to be executed. After stepping through to the end of the code below (we can do this by pressing the **Last** button), how many variables (excluding those that refer to functions) will be on the stack? Recall that the stack is represented by the images on the left-hand side of the model. (If the image is too small, right-click on it and open it in a new browser tab. Then you can zoom in.)

```

1 def convert_to_minutes(num_hours):
2     """ (int) -> int
3
4     Return the number of minutes there are in num
5     hours.
6
7     >>> convert_to_minutes(2)
8     120
9     """
10
11     result = num_hours * 60
12     return result
13
14 hours_asleep = 5
15 minutes_asleep = convert_to_minutes(hours_asleep)

```
